

Practice 2 - Teedy Setup

Deadline: Week 3.

Checking method: onsite during the lab session.

Please complete the following tasks:

1. **Prepare the environment:** Ensure all required dependencies are installed on your system.
2. **Obtain and build Teedy:** Create a new repository in your GitHub account using the Teedy template. Clone the repository and build the project.
3. **Launch a Teedy instance:** Start a Teedy instance on your machine.
4. **Modify the Jetty configuration to access Teedy directly at localhost:8080**
5. **Ensure documents persist after a server restart:** You may notice that while Teedy allows uploading and managing documents, any documents created in the web interface are lost after restarting the Teedy server. Modify the project so that Teedy retains the documents even after a server restart.

Verification:

1. Show the following interface to the instructor or TA:

2. Create a document in Teedy.
3. Restart the server.
4. Log in again and check if the previously created document is still available.

💡 Tips: Boost Productivity with AI

AI tools can accelerate your understanding of Teedy's codebase. Popular options include **VS Code + GitHub Copilot** or **Cursor IDE**.

Quick Start:

1. Open Teedy in VS Code.

2. Use the chat panel(**Ctrl+Alt+I**) to ask architecture questions (e.g., `@workspace How does pom.xml work?`).
3. Use inline chat (**Ctrl+I**) to refactor or explain selected code.

Best Practices:

- **Verify:** AI may hallucinate. Always review critical logic.
- **Be Specific:** Provide context (e.g., "dev profile") for better results.
- **Iterate:** Refine your prompts if the first answer isn't perfect.
